PROFILE

Fullstack engineer who takes on whole systems: from the data schema to the production deploy. Over 5+ years I have built microservice platforms, government-system integrations, offline-first mobile apps and binary-protocol decoders — several of them end to end and single-handed. I make architecture decisions at every layer, prioritizing performance, maintainability and real business impact.

CORE STACK

PRIMARY

Node.js NestJS React TypeScript Next.js React Native Laravel PHP Microservices
REST APIs WebSockets / TCP MySQL PostgreSQL Angular Docker
AWS (ECS, ECR, RDS, ALB, S3, CloudFront)

ALSO

Python Django Git Linux Redis Three.js Testing (Vitest, Testcontainers) CI/CD Scrum / Agile

EXPERIENCE

ArrowFin

Fulltime

Jun 2025 – Present

Fullstack Developer → Technical Lead

- Technical owner of **Edgeclear Insights**, the platform that turns brokers' raw executions into the statistics a trader actually needs: **six coordinated services** over three external sources normalized into one domain model.
- Optimized the data consolidation pipeline: **8M records from 28 hours to 18 minutes**.
- Built the ingestion service in **NestJS with hexagonal architecture** — history over WebSocket and live trades over the DTC protocol — plus the real-time layer that pushes changes to the frontend over sockets.
- Designed the **React + TypeScript** frontend with skeleton loaders, lazy loading and live updates, querying **6M+ financial trades** on demand.
- Deployed the entire cloud infrastructure on **AWS from scratch** (ECS, ECR, ALB, RDS, CloudFront, S3, ACM, IAM) with full Dockerization, and migrated authentication to **FusionAuth** as the company-wide SSO.

Galaxia Seguridad

Freelance

Apr 2022 – Jun 2026

Fullstack & Systems Architect

- **Designed and built the entire platform single-handed**: API Gateway, six microservices each with its own database, two web applications, a mobile app and a binary-protocol decoder. It runs the daily operation of **1,000+ employees** and replaced **4 third-party services** the company had been paying for.
- Transformed the legacy monolithic application into a **NestJS microservices** platform with an API Gateway and per-domain databases, centralizing nationwide operations: **25K daily events**.
- Built the **offline-first** field mobile app in React Native: a local **SQLite queue with idempotency keys** and background sync, so saving a report never fails even with no signal. **12 operational modules**, deployed across **5 cities**.
- Developed the **TCP server that decodes binary GT06 frames** from GPS devices: **CRC-16/ITU**-signed ACK, BCD IMEI, and extraction of position, speed, battery and panic alerts, monitoring **~40 vehicles**.
- Implemented **per-client row-level isolation** minted into the JWT and enforced by every microservice, and established **two-tier testing** — unit tests against typed fakes and e2e over an ephemeral PostgreSQL with Testcontainers — with CI on GitHub Actions.

Satori IPS

Freelance

Feb 2025 – Jul 2026

Fullstack Architect

- Built the **complete clinical ERP** — Laravel API, React frontend and patient portal — covering scheduling, medical records, billing, inventory and the quality module for Ministry of Health licensing. **Presented at AMWC Latin America 2025.**
- Developed a **natural-language query assistant** (FastAPI + LLM) over the clinical database, with **three independent read-only layers**: a database user without write permission, a validator rejecting any non-SELECT query, and a prompt-level restriction. Only the schema travels to the model — no patient data leaves the infrastructure.
- Developed the **NestJS microservice** that interoperates with Colombia's **Ministry of Health IHCE**: assembling the Digital Care Summary as a **FHIR Bundle**, diagnoses coded in ICD-10, sections tagged with LOINC and professional validation against RETHUS.
- Implemented an **interactive 3D procedure guide with Three.js** — physicians annotate treatment points on a face model — and the patient portal with **legally defensible digital consents**: selfie, traced signature and reading tracking.
- Results in operation: **70% less patient dropout** and full traceability of clinical inventory, which used to go out of balance almost every month.

Reno Ectual

Freelance

Nov 2025 – Apr 2026

Fullstack Developer

- Designed and built the complete product: a **Next.js storefront**, the internal ERP with a **Laravel REST API** and a **React frontend**, and an **electronic invoicing microservice** — for a company selling auto parts to insurers by auction with credit terms at 30, 45 and 60 days.
- Developed the **electronic invoicing microservice with direct DIAN integration** (Colombia's tax authority), built on an **idempotent state machine**: external identifiers are persisted even when the invoice fails, so a retry reuses instead of duplicating, and errors are classified as retryable or fatal.
- Built the reporting system with **two export engines** — streaming with a constant memory footprint for large volumes, and a styled engine for those needing formatting and live formulas — with **13 reports in production**.

Serviunix

Fulltime

Oct 2023 – Feb 2025

Development Lead

- Led the development team: managed projects, gathered requirements, defined architecture, and guided junior developers.
- Built custom corporate applications using PHP, Laravel, Vue, React, and Django across multiple client engagements.

Hack A Boss

Fulltime

Oct 2023 – Oct 2024

Fullstack Developer

- Developed new features and resolved production incidents for LogRoot, a SaaS HR and time-tracking platform in PHP and JavaScript.

EARLIER EXPERIENCE

Psicol Feb-Oct 2023 · Clase de Excel Apr 2022-Feb 2023 · Galaxia Seguridad (contract) Oct 2021-Apr 2022 · Flores Isabelita Apr-Sep 2021

Fullstack development with Laravel, PHP, Vue, React Native & MySQL across SaaS and corporate projects.
